Subject:

Sequence search request for 09/922683

From: Manjunath N. Rao

Art Unit 1652, Room 10A11 Mail Box in Room 10D 01

Phone: 306-5681

Date: 5-21-03

Please search the following as soon as possible for application with serial number 09/922683

1. SEQ ID NO: 7, against all <u>commercial nucleic acid databases</u> including <u>issued patents database</u> and <u>pending</u> <u>application database</u> and provide a <u>print of all results</u>.

If you have any questions please call me at the above phone number.

Thanks

Manjunath N. Rao, Ph.D. Biotechnology Patent Examiner Art Unit 1652, Room 10A11 Mail Box in 10D01 Crystal Mall 1, USPTO.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Streptomyces peucetius.
Streptomyces peucetius.
Streptomycea peucetius.
Bacteria: Firmicutes; Actinobacteria; Actinobacteridae; Actinopacteriaes; Streptomyciaes; Streptomyciaes; Streptomycetaeses; Streptomyciaes; Streptomyceaes; Streptomyces...

E 1 (bases 1 to 2682)
The dnrM gene in Streptomyces peucetius contains a naturally occurring frameshift mutation that is suppressed by another locus outside of the daunorubicin-production gene cluster

CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.
Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene
